

Roundtable Information

With advancements in technology and science, we are at the cusp of scientific innovation with genetic medicine. The scientific community has made incredible advances in the development of new innovative therapies, such as gene therapies, with up to 20 new gene therapy approvals expected annually by 2025. While gene therapy represents a radical shift in our approach to disease treatment, this novel approach poses new challenges for health systems. This roundtable will be an opportunity for representatives across stakeholders—including academia, civil society, industry, patient communities, healthcare professionals, and governments—to learn about advances in gene therapy and discuss current health system barriers and potential solutions to gene therapy delivery and access. We hope this forum will offer an opportunity to engage in a dynamic discussion and share insights into how countries are preparing for these new innovations.

We look forward to seeing you at the World Health Summit!
